

1. Deliverables Overview

Food Delivery Analytics Project

The project deliverables cover data preparation, descriptive analysis, visual outputs and a dashboard-ready framework.

1.1 End-to-End Flow

Source: Food Delivery.ipynb analysis workflow and stated outputs.

2. Data Preparation Deliverables

Detailed preparation steps from the notebook

- 1 Remove columns with more than 50% null values.
- 2 Convert Order_Date to datetime.
- 3 Inspect categorical and numerical fields.
- 4 Check duplicated records.
- 5 Fill numerical missing values with the median.
- 6 Fill categorical missing values with the mode.
- 7 Use IQR to define Time_Taken_Min outlier limits.
- 8 Filter Time_Taken_Min outside the IQR limits.

2.1 Preparation Output

A cleaned analytical dataset is produced before visualization and further analysis. The notebook then exports the prepared data to Food Delivery Analytics.xlsx.

3. Performance Analysis Deliverables

Descriptive analysis and visual outputs

1

Delivery-time histogram

Shows the distribution of Time_Taken_Min after preparation.

2

Top 10 cities by average delivery time

Ranks cities using mean Time_Taken_Min.

3

Festival vs non-festival orders

Shows order-count split using Festival.

4

Average delivery time by order hour

Plots hourly average Time_Taken_Min.

5

Correlation heatmap

Displays correlations among numeric variables.

4. Dashboard Deliverables

Recommended management-facing structure based on the analysis

1. Executive KPI

Average delivery time, order volume and key operational summary metrics.

2. City Performance

Rank and compare cities by average delivery time.

3. Time Performance

View average delivery time across order hours.

4. Operational Context

Use traffic, weather, distance and delivery-related dimensions for interpretation.

5. Data Quality

Source: Food Delivery.ipynb analysis workflow and stated outputs.

Make preparation rules and KPI consistency part of the reporting process.

5. Deliverable-to-Decision Map

How the analysis supports business action

1. City analysis

Identify locations with higher average delivery times.

Action

Operational review / capacity attention

2. Hour analysis

Identify time periods with higher average delivery time.

Action

Rider/resource planning

3. Distribution analysis

Understand normal delivery-time pattern and spread.

Action

Set realistic performance expectations

4. Operational variables

Investigate traffic, weather, distance and multiple deliveries.

Action

Root-cause investigation

5. Dashboard monitoring

Bring KPIs and patterns together.

Action

Recurring management decisions

Outcome: convert the notebook analysis into a practical, dashboard-ready business deliverable.
